

MORSE APPLICATION

in this task, i build a app that converts text to morse code based on international morse charset, it can convert text to morse code and vice versa, it plays the sound of those morse codes like are telegrams, and also present morse code characters in text form that can be included for password security or as a handwritten message. I use dict function to define letter-by-word for each symbol type and iterate through them in loops.

I also built a simple interface based on python's tkinter library, so that users can easily convert between text and encoding types.
